Machine Learning for Predictive Analytics Mini Sprint

Predicting Attrition rate for Bain and Company from the HR Dataset

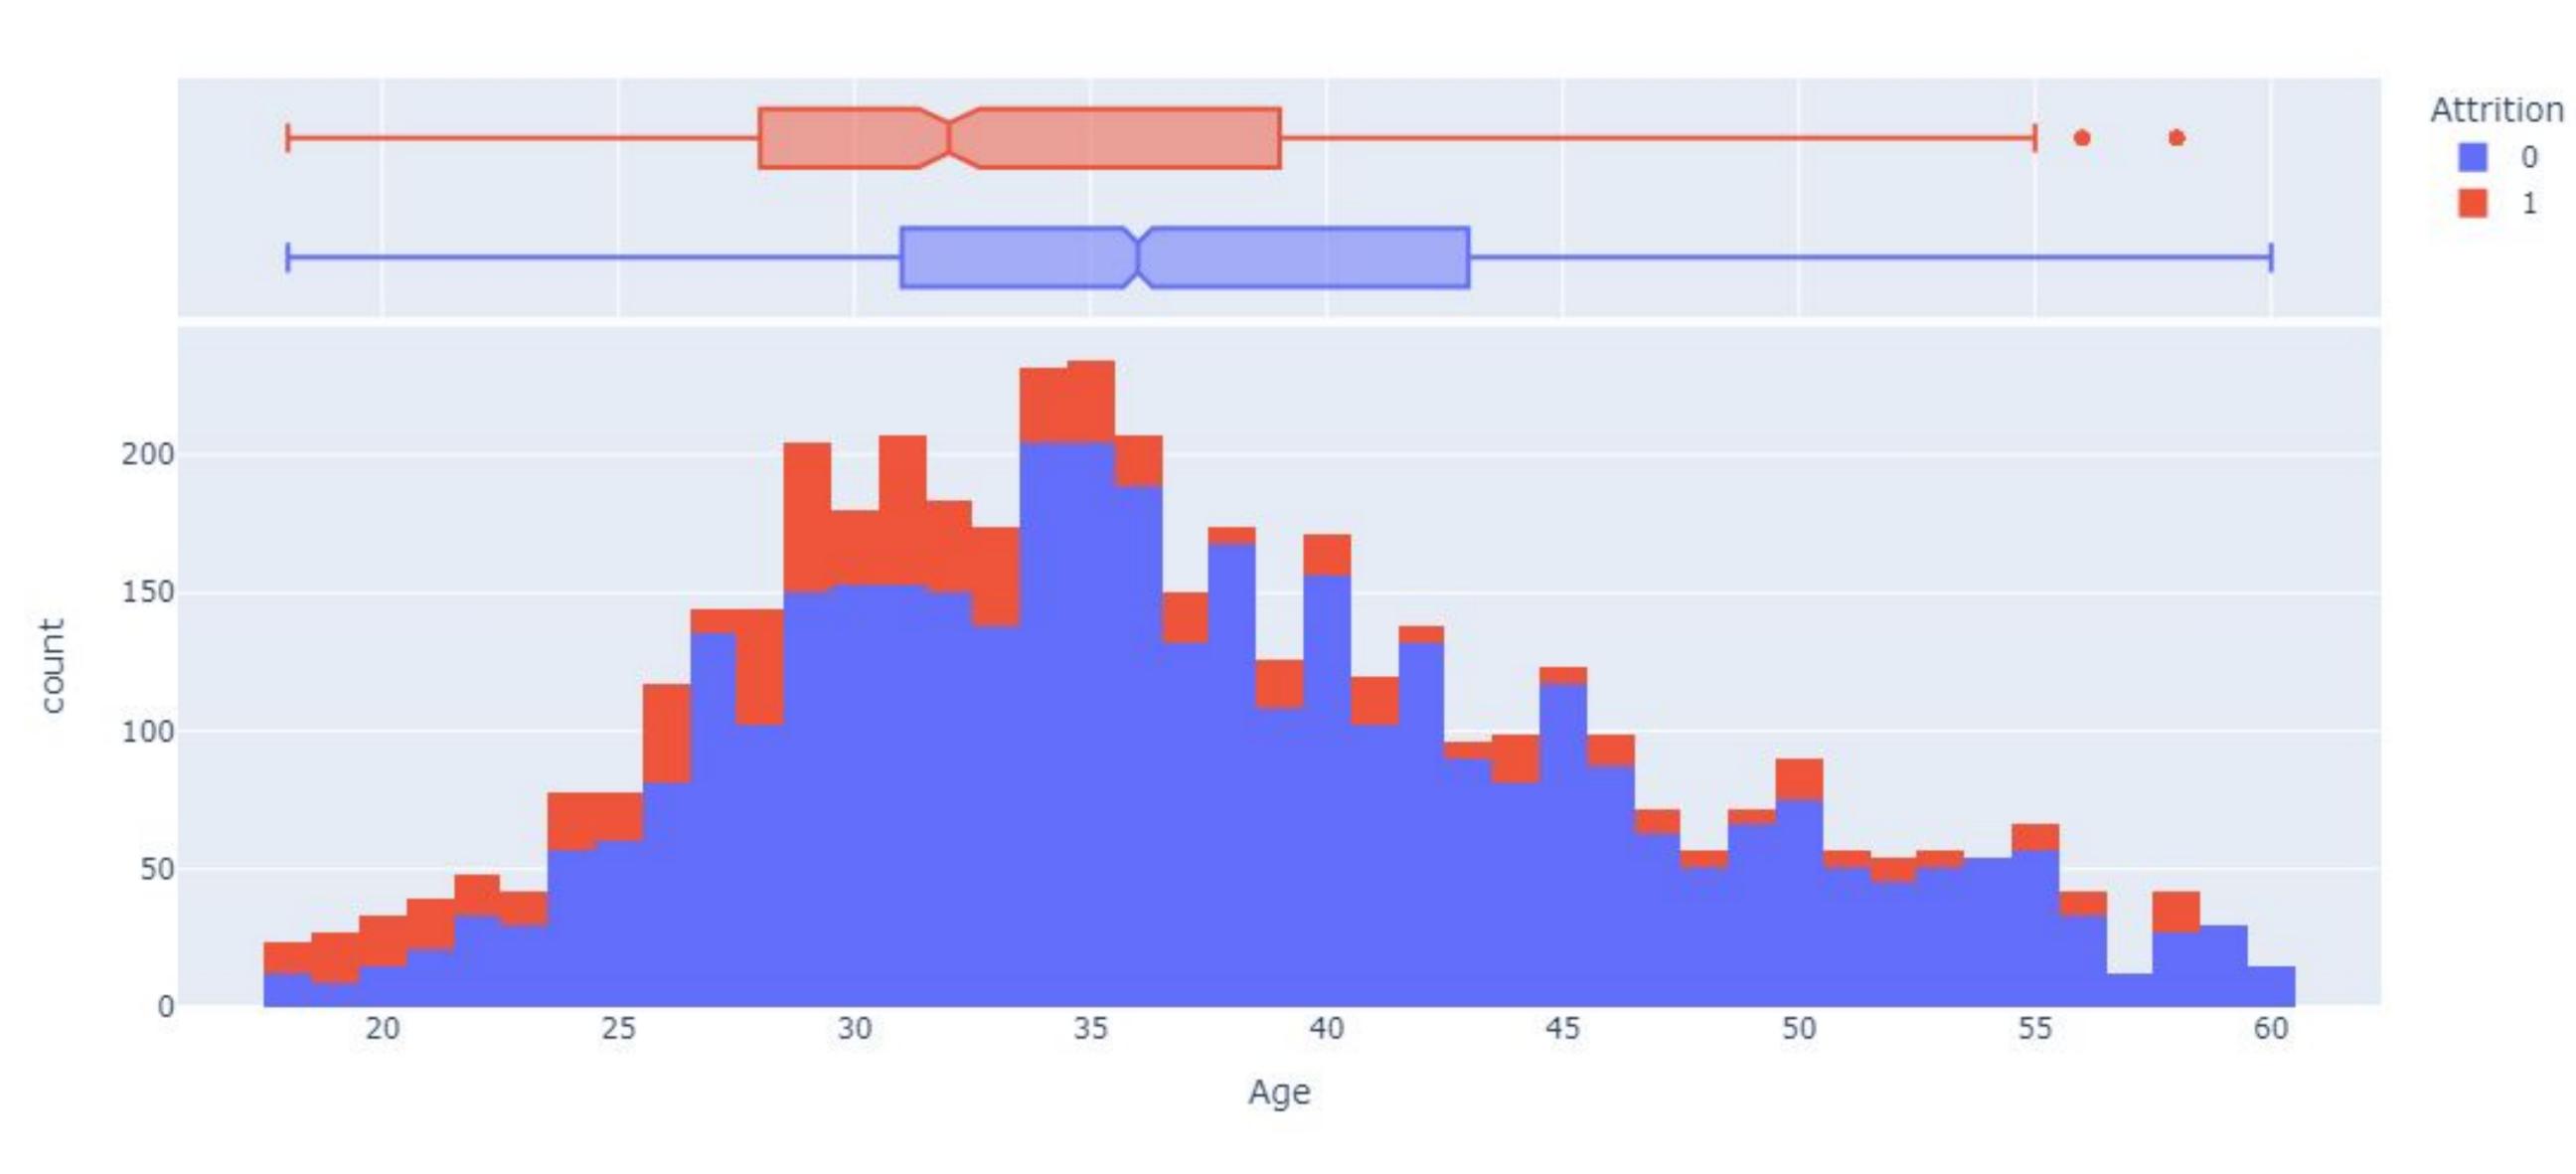

Saima Ahmed (Individual Contribution)

My objective is to develop a machine learning model to predict employee attrition rates. This model will minimize overfitting and achieve good performance metrics. By providing HR with accurate insights into employee departure risks, the model will empower them to implement effective retention strategies and improve employee satisfaction.

Data Analysis Summary

Employees statistics who leave the company

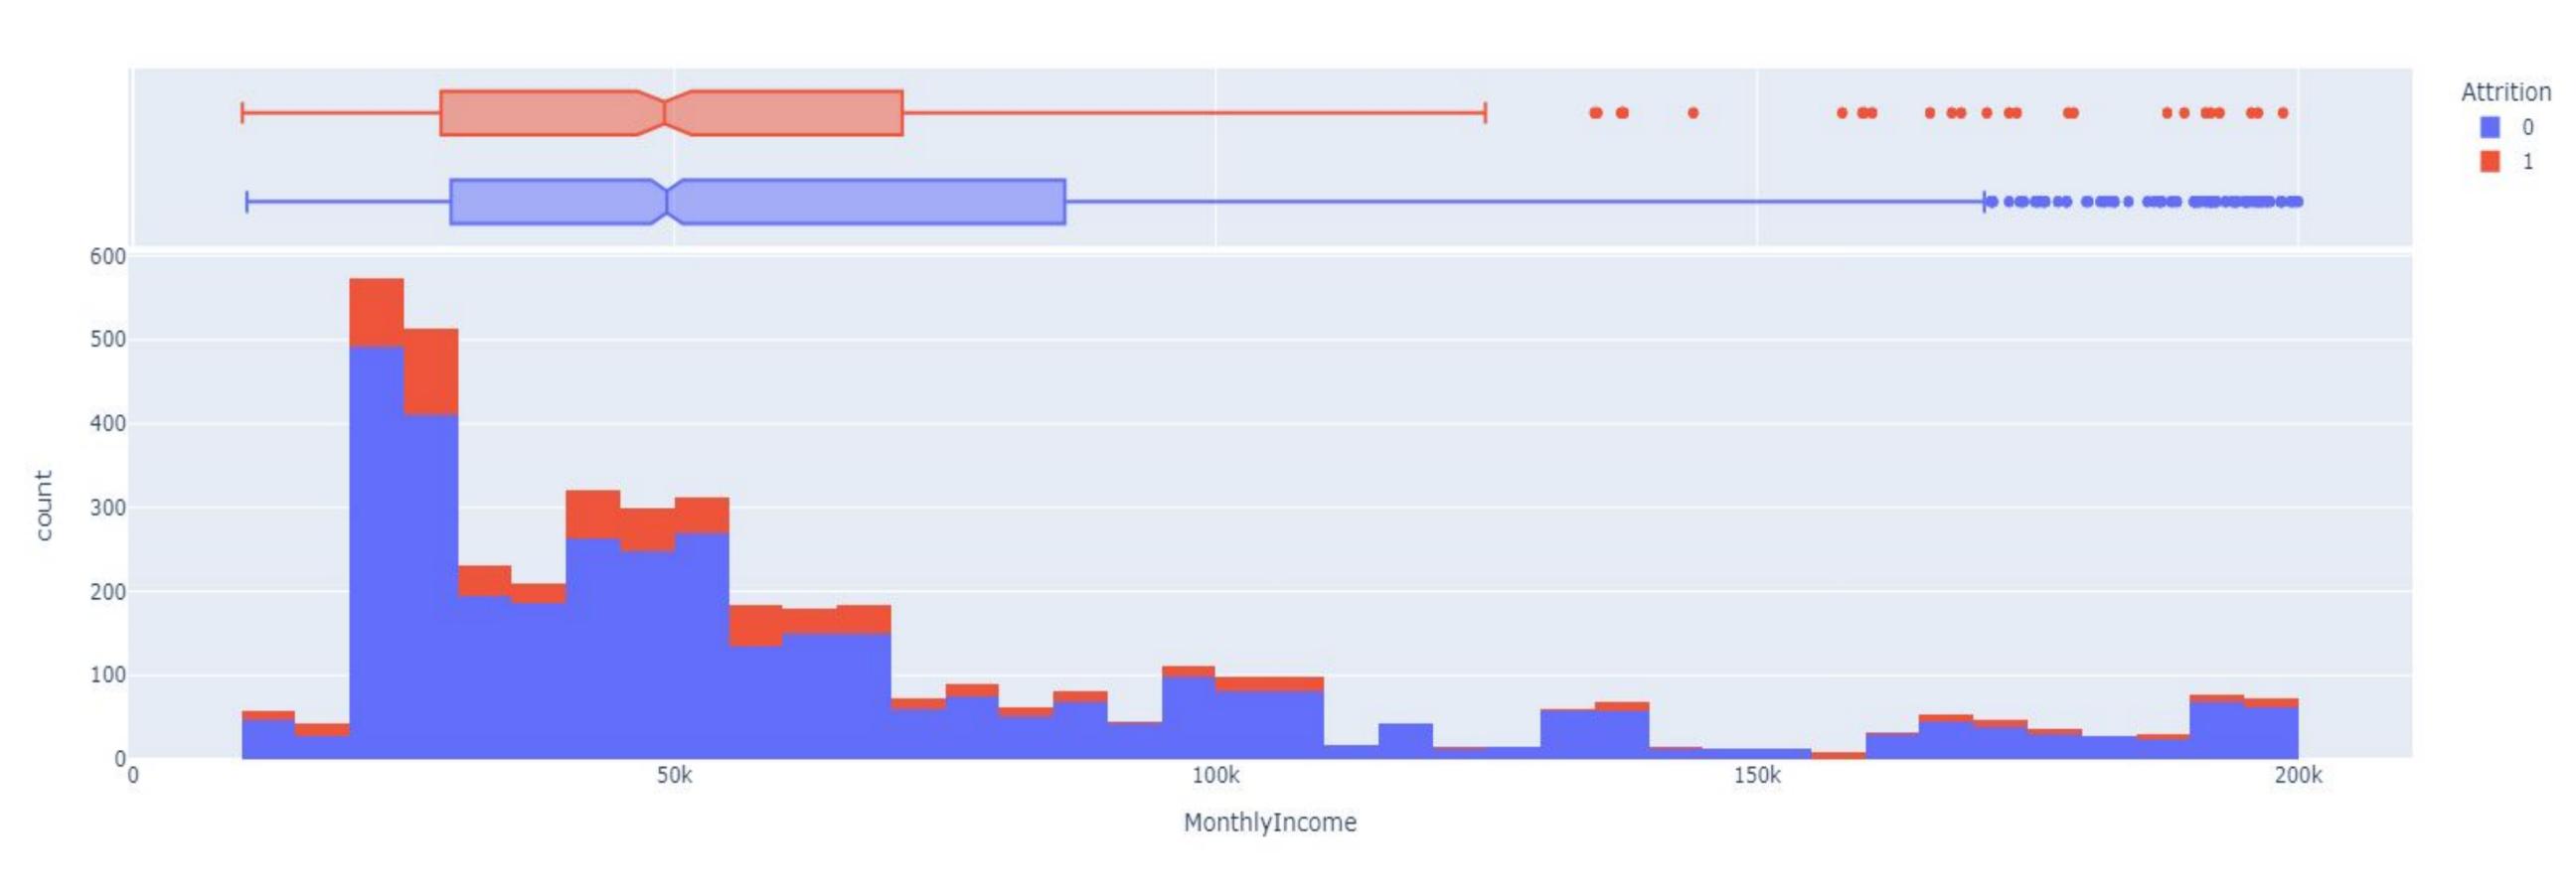

- 1. Age 25-35 years
 - a. 63.3% of men left the job as compared to 36.7% women.
- 2. Most people who leave a job have a low salary.
 - a. Monthly income bracket (20- 70K) As income increases, attrition decreases.
- 3. Percentage Salary Hike less than or equal to 14%
- 4. Stock Option Level- 0 and 1 level
- 5. Job Level Junior to mid-Junior
- 6. Education College to Bachelor
- 7. Number of years worked one year
 - a. Most people who work in the company had less than 1 year experience with the current manager.
- 8. Total Working Years- 1, 5 and 10 years
- 9. Training Times Last Year 2 and 3 times
- 10. Years since Last Promotion-0-2 years
- 11. Job Involvement- 2-3 levels
- 12. Performance Rating 2-3 rating
- 13. Work Life Balance 3 rating
- 14. Most people leave the company who travel rarely.
- 15. Most people who leave the job come from research and development department, 63.7%.
- 16. Most people who leave their job were working as a sales executive, research scientist and laboratory technician.
- 17. Most people who leave the company studied life sciences
- 18. Most people who leave the job aren't satisfied with the work environment.

Feature: Age - 25-35 years.

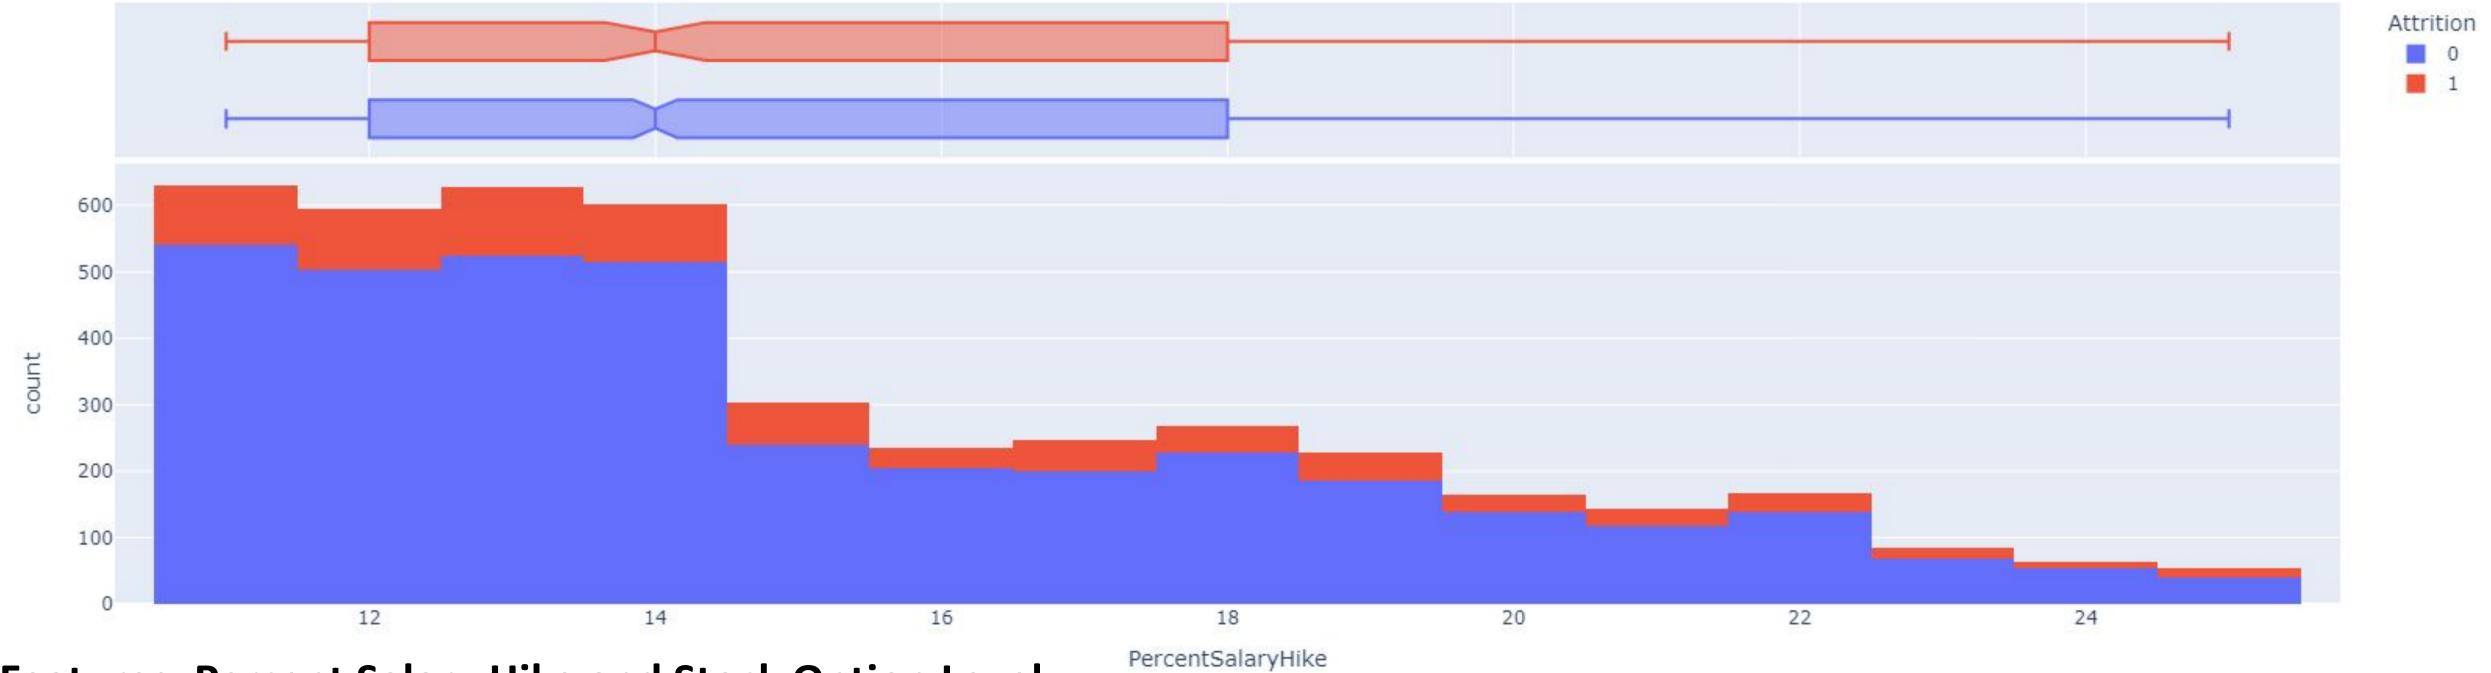

Feature: Gender - 63.3% of men left the job as compared to 36.7% women.

Attrition ->1

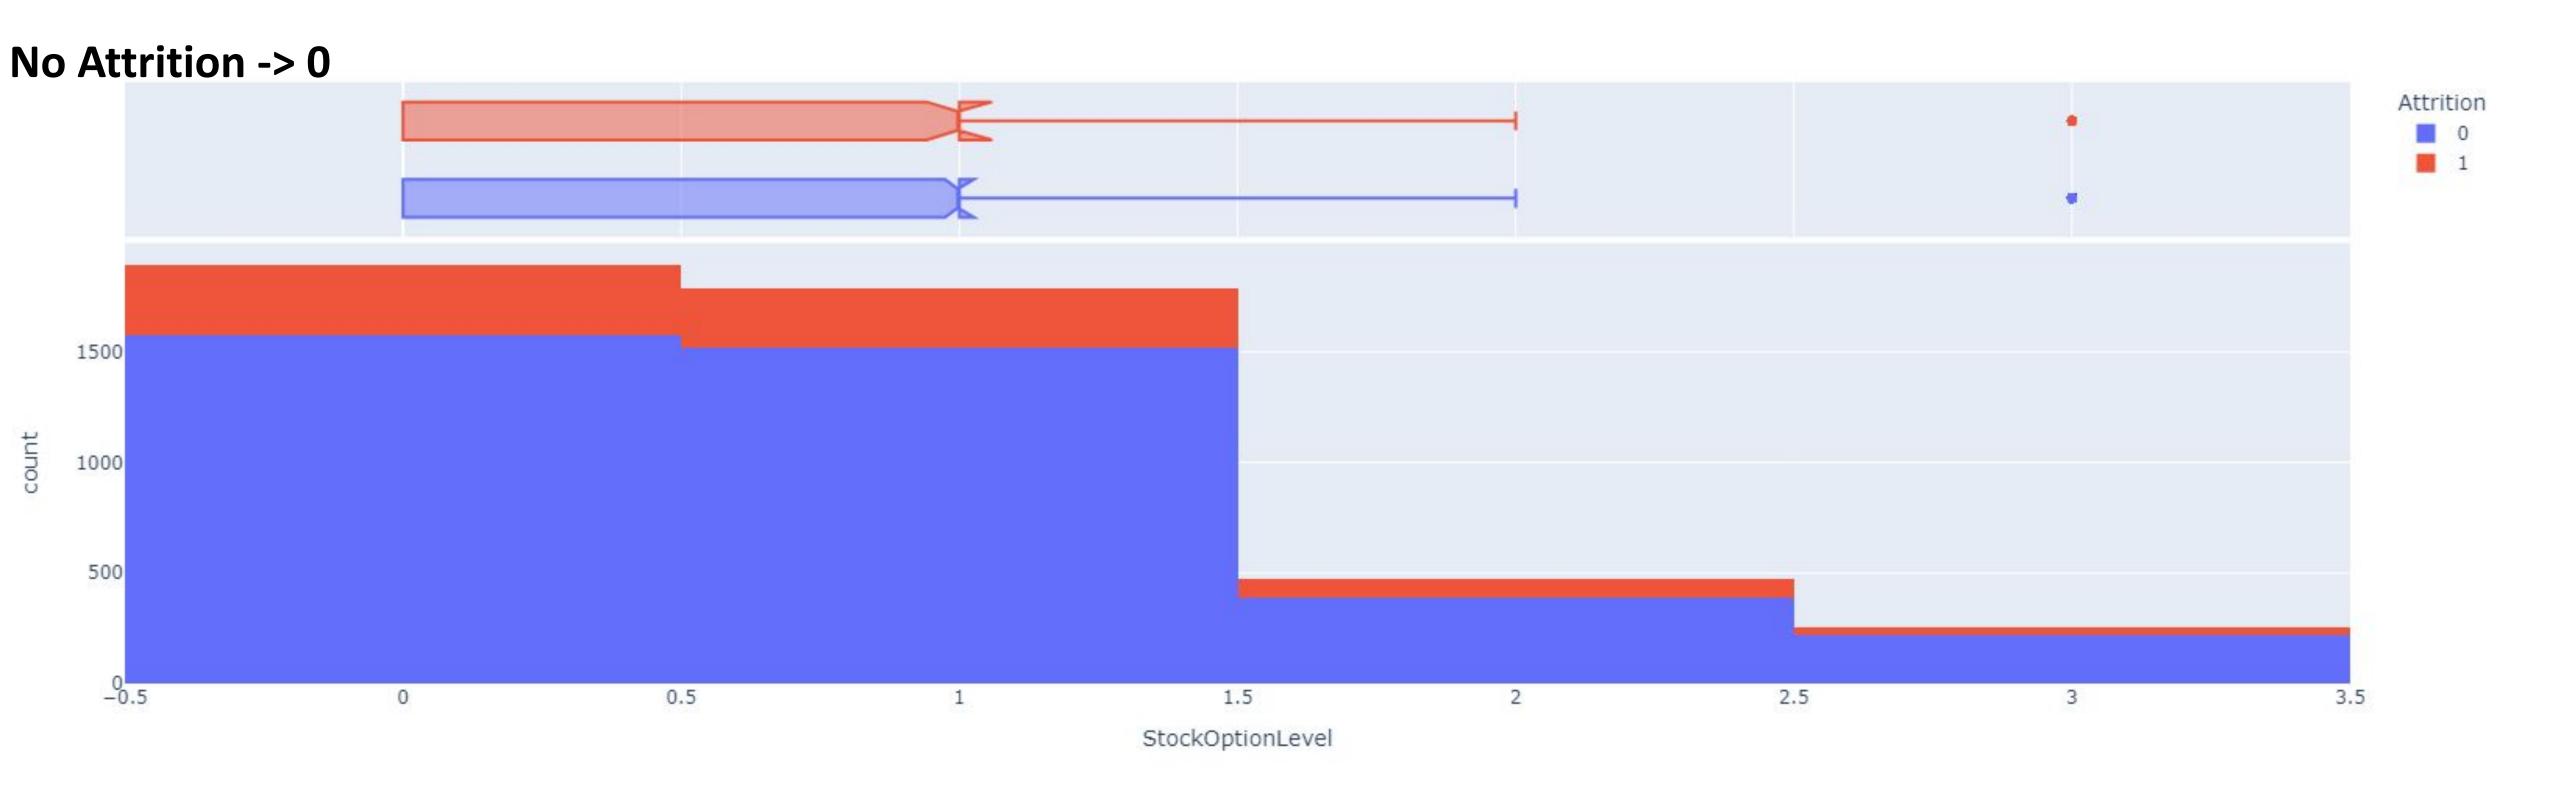

Feature: Monthly Income

Attrition ->1

Features: Percent Salary Hike and Stock Option Level

Attrition ->1

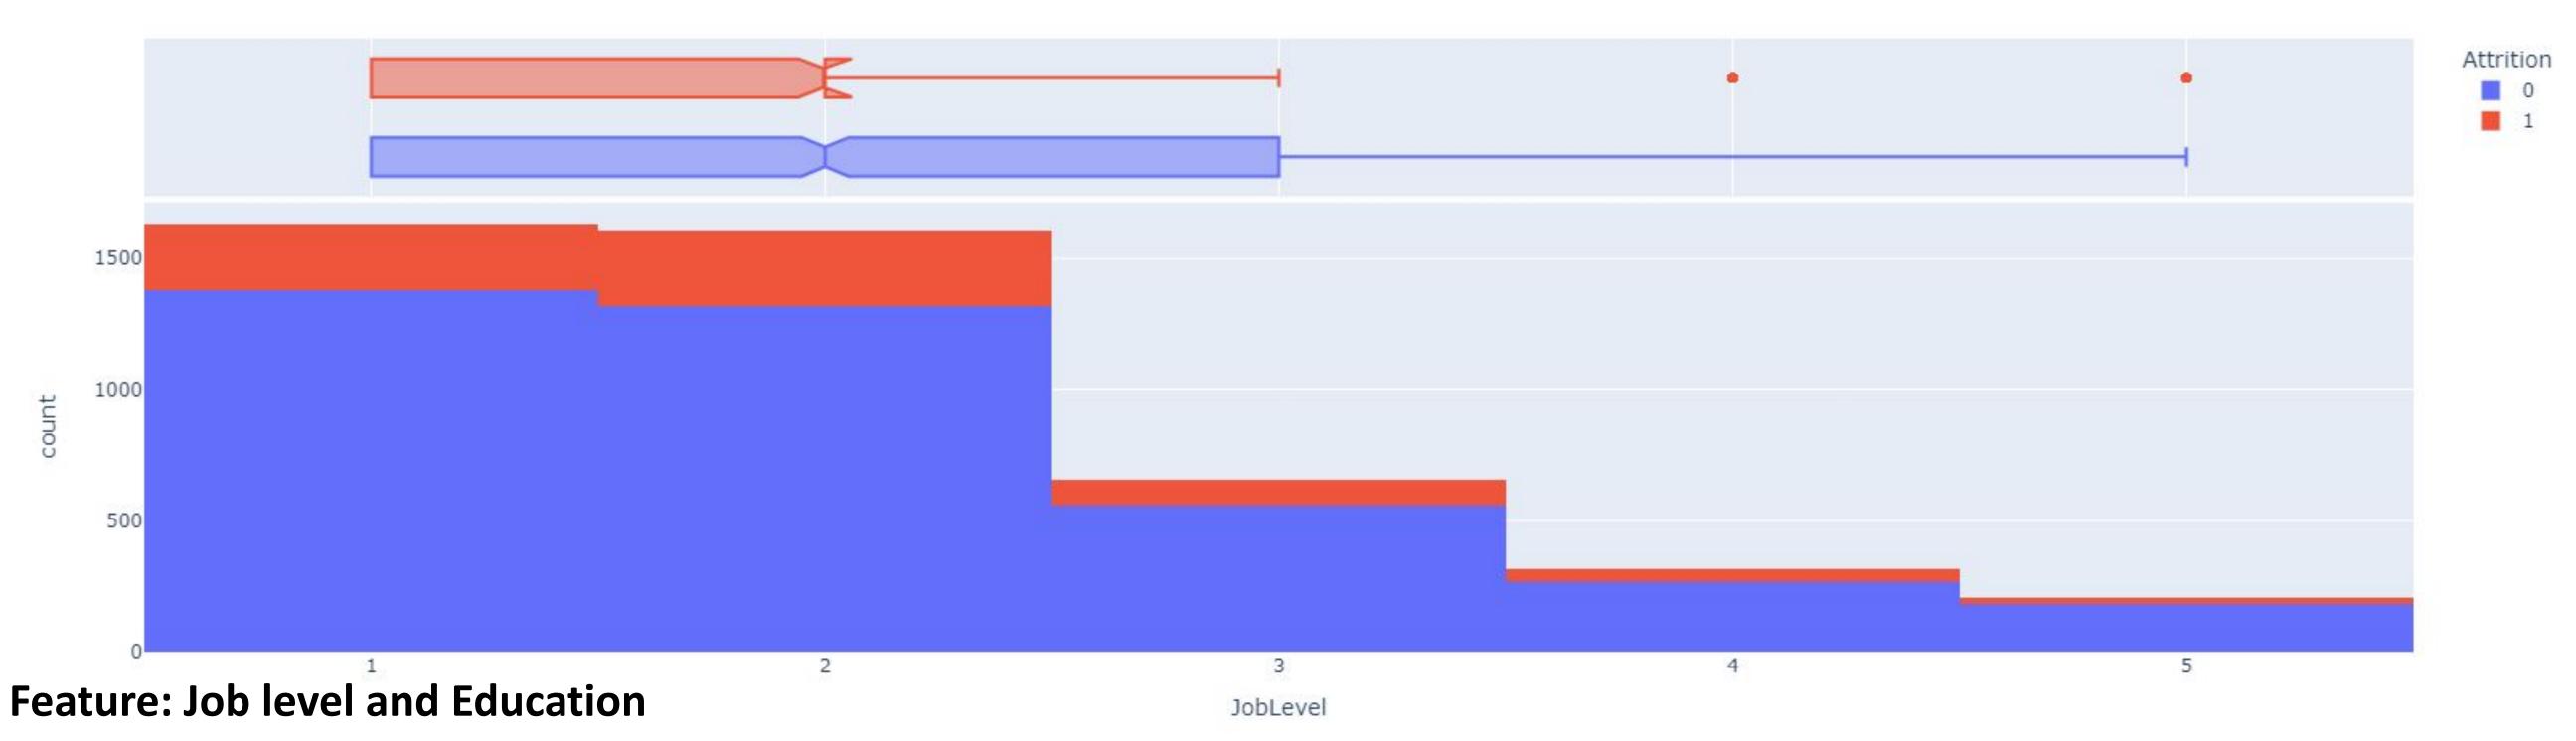

Takeaways

Data Insights

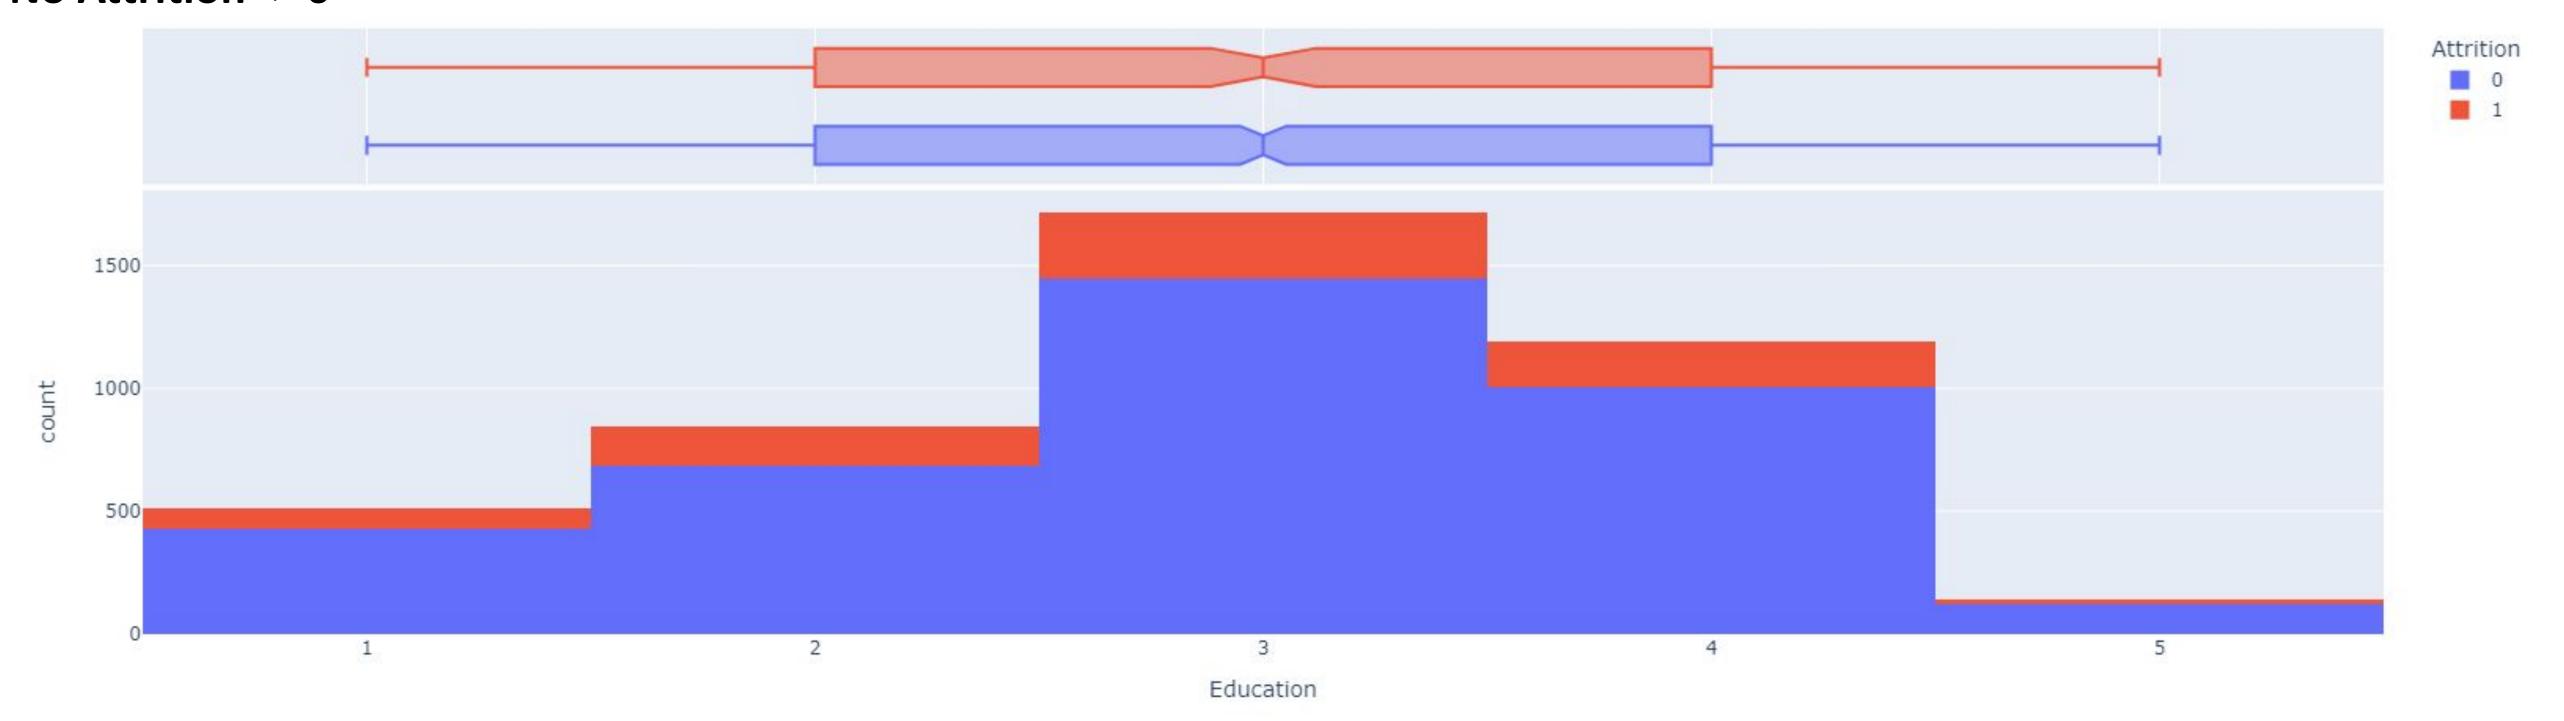

- Most people who leave a job have a low salary.
 - Monthly income bracket (20- 70K) As income increases, attrition decreases.
- Percentage Salary Hike less than or equal to 14%.
- Stock Option Level- 0 and 1 level.

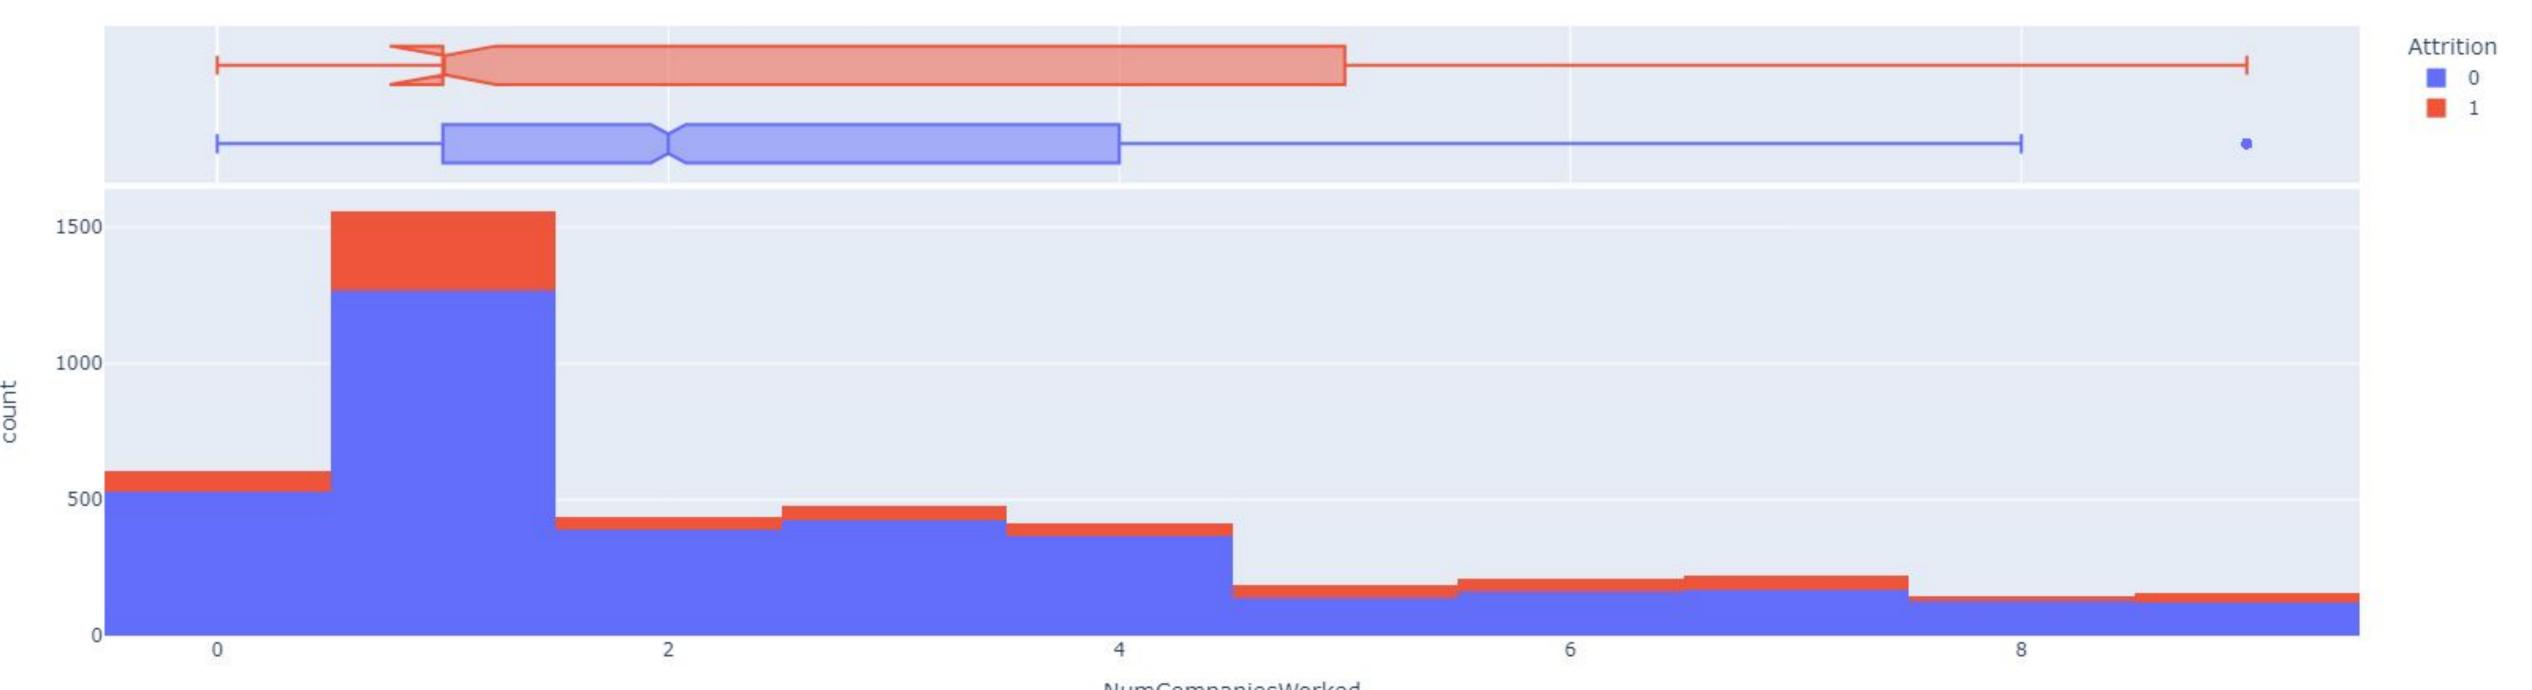

Suggestions

- Conduct regular salary reviews
 - Compensated competitively.
- Evaluate benefits package
 - Flexible work arrangements, wellness programs, or educational reimbursements.
- Performance based Rewards
 - Performance-based bonuses incentives to motivate employees.

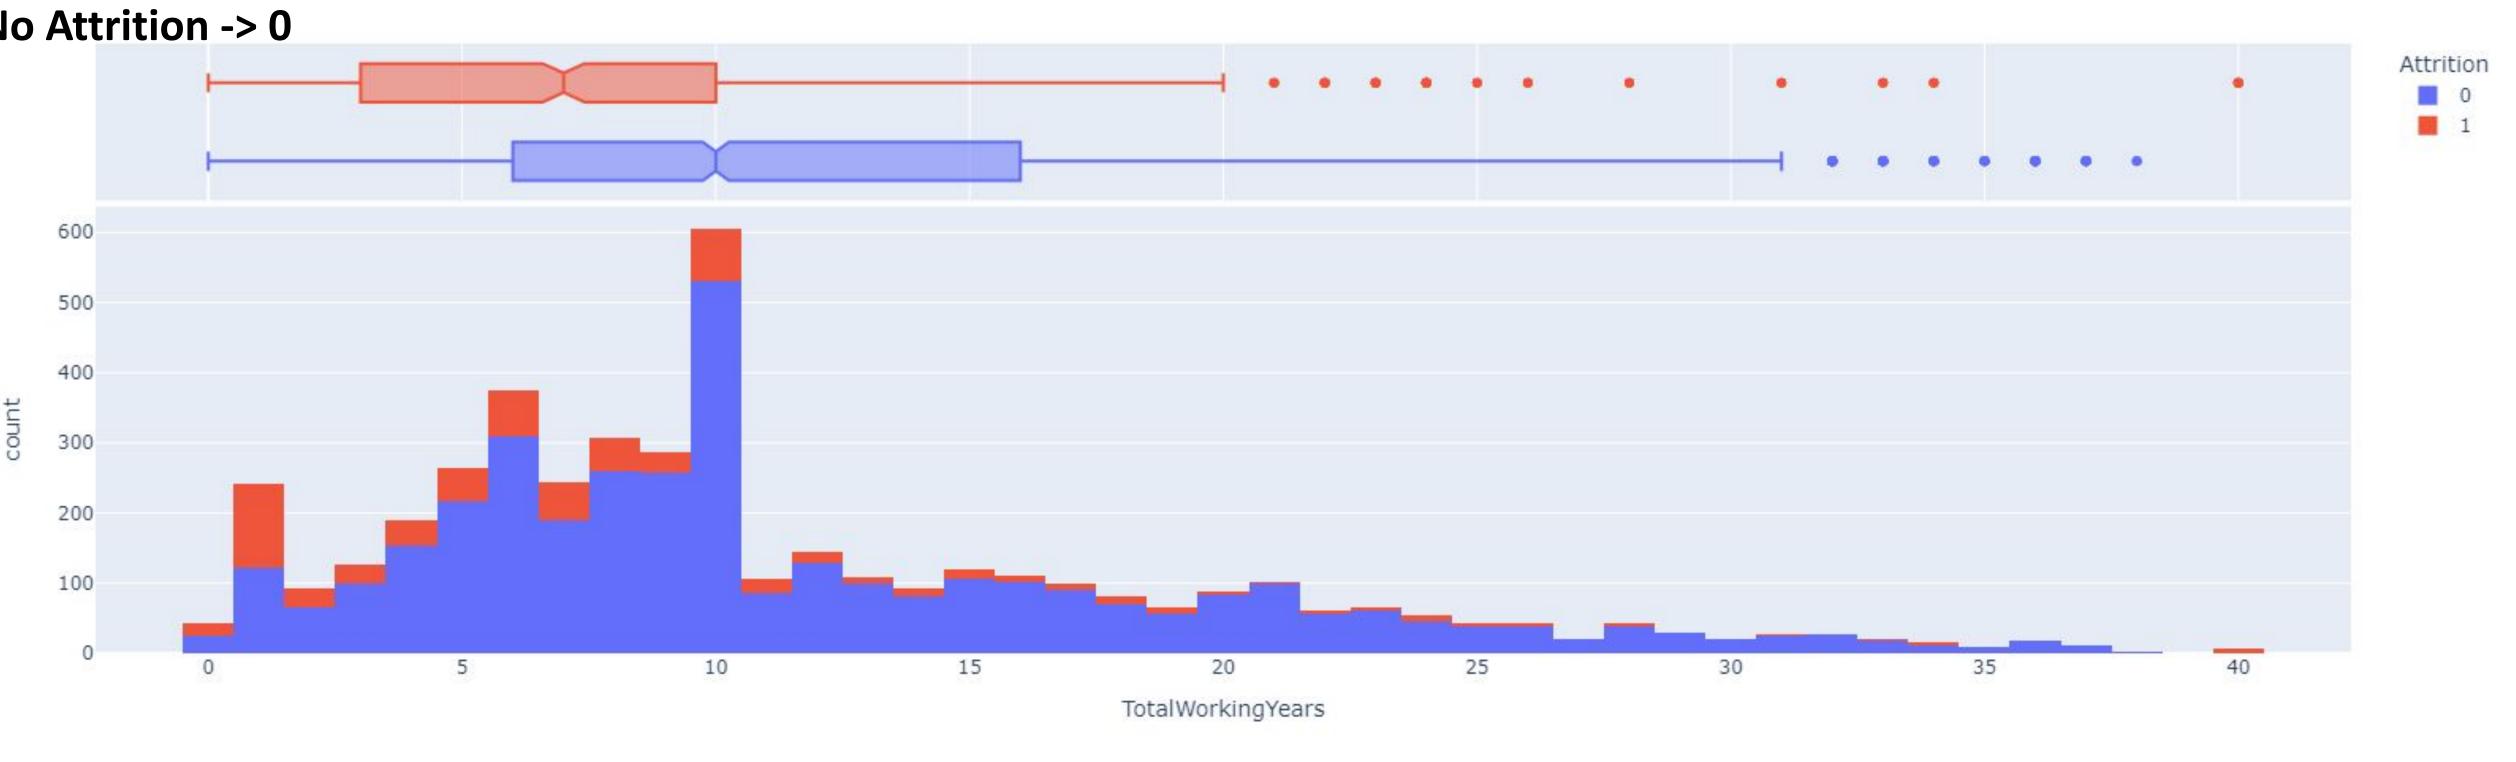

Attrition ->1

eature: Num Companies Worked and Total Working Years NumCompaniesWorked

ttrition ->1

Takeaways

Data Insights

- Most people who leave a job has job level- Junior to mid-Junior- 1 and 2 level.
- Education College and Bachelor.
- Total Working Years- 1, 5 and 10 years.
- Number of years worked one year.
 - Most people who work in the company had less than 1 year experience with the current manager.

Suggestions

Career Path Visibility

• Clearly outline **potential career paths** within the company. Show junior staff how their current role can lead to **future opportunities for advancement**.

Mentorship Programs

 Establish mentorship programs that pair junior staff with experienced colleagues who can provide guidance and support.

Internal Job Postings

 Give junior staff priority access to internal job postings before opening positions to external candidates. This demonstrates your commitment to their growth within the company.

Tuition Reimbursement

Offer tuition reimbursement programs for relevant academic or professional development courses.

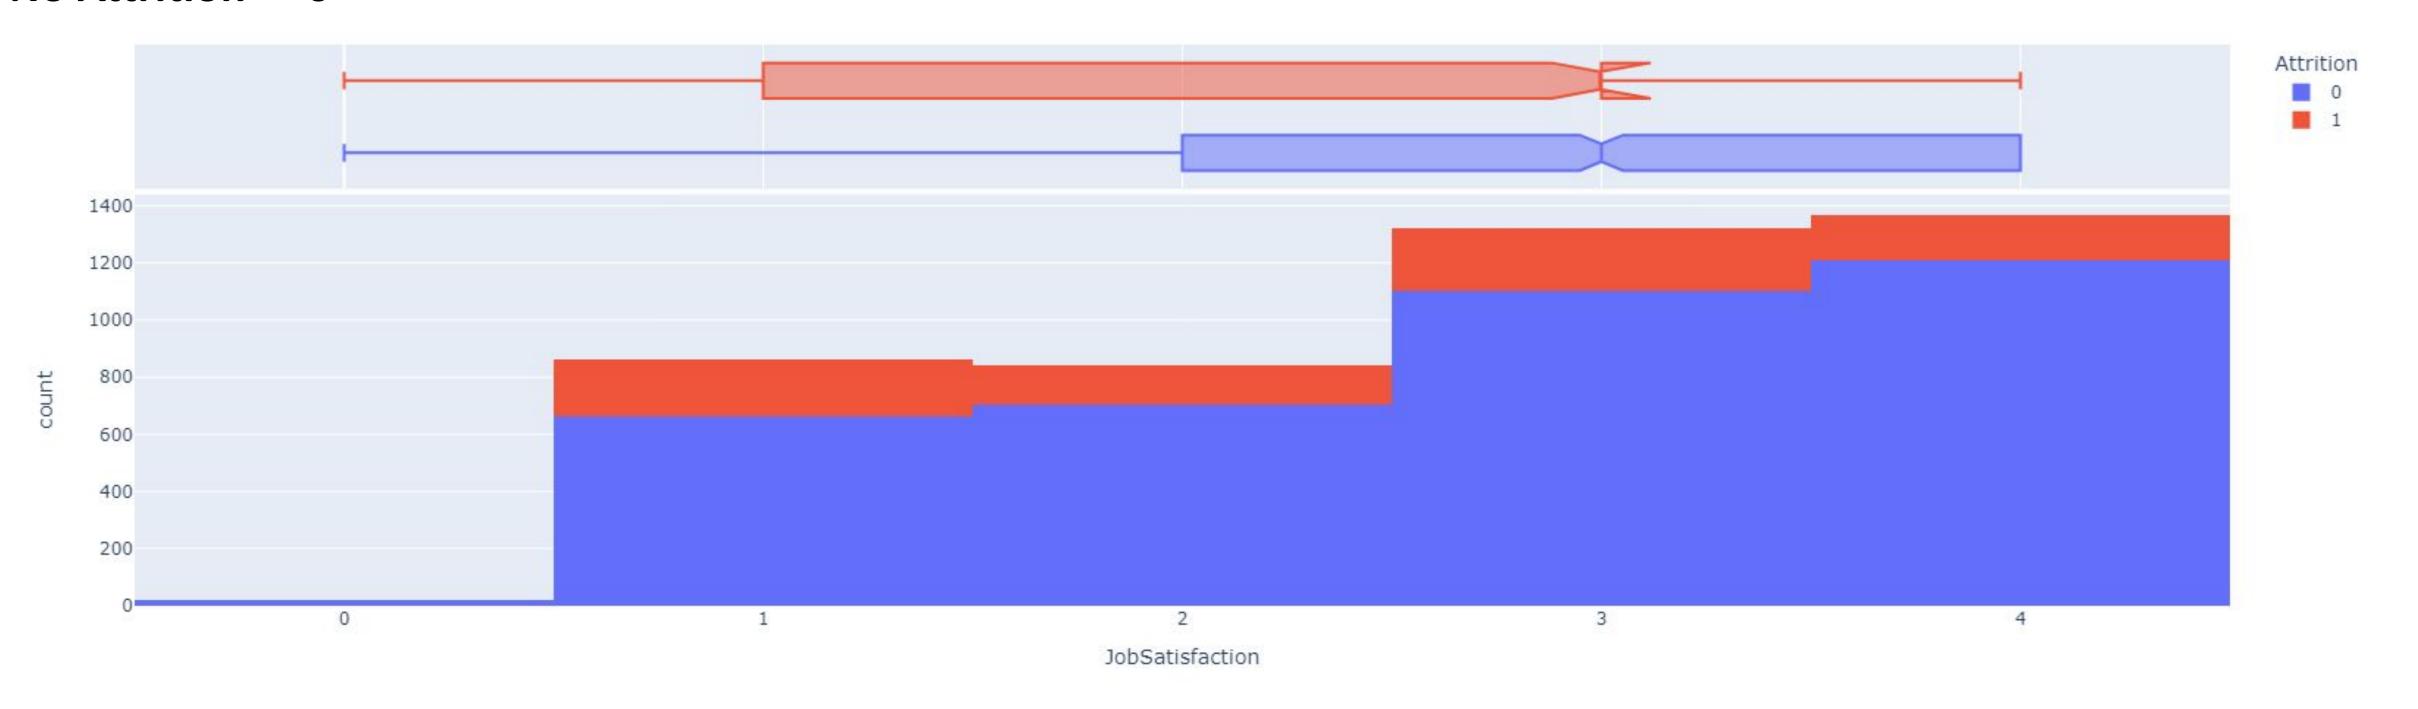

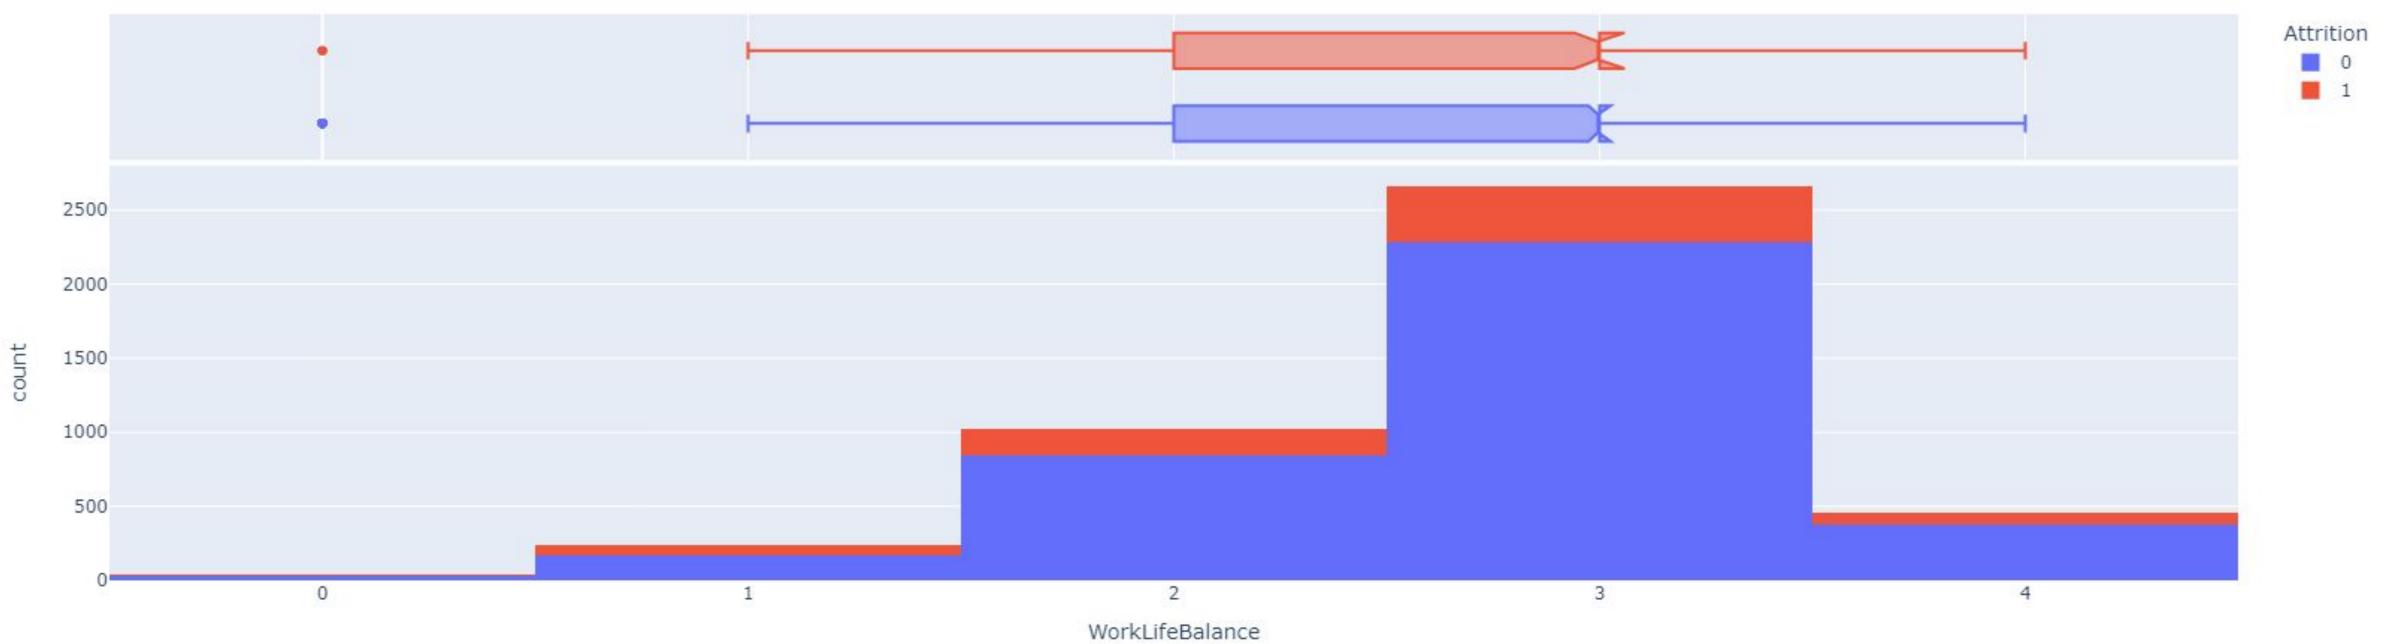

Feature: Environment Satisfaction and Job

EnvironmentSatisfaction

Satisfaction

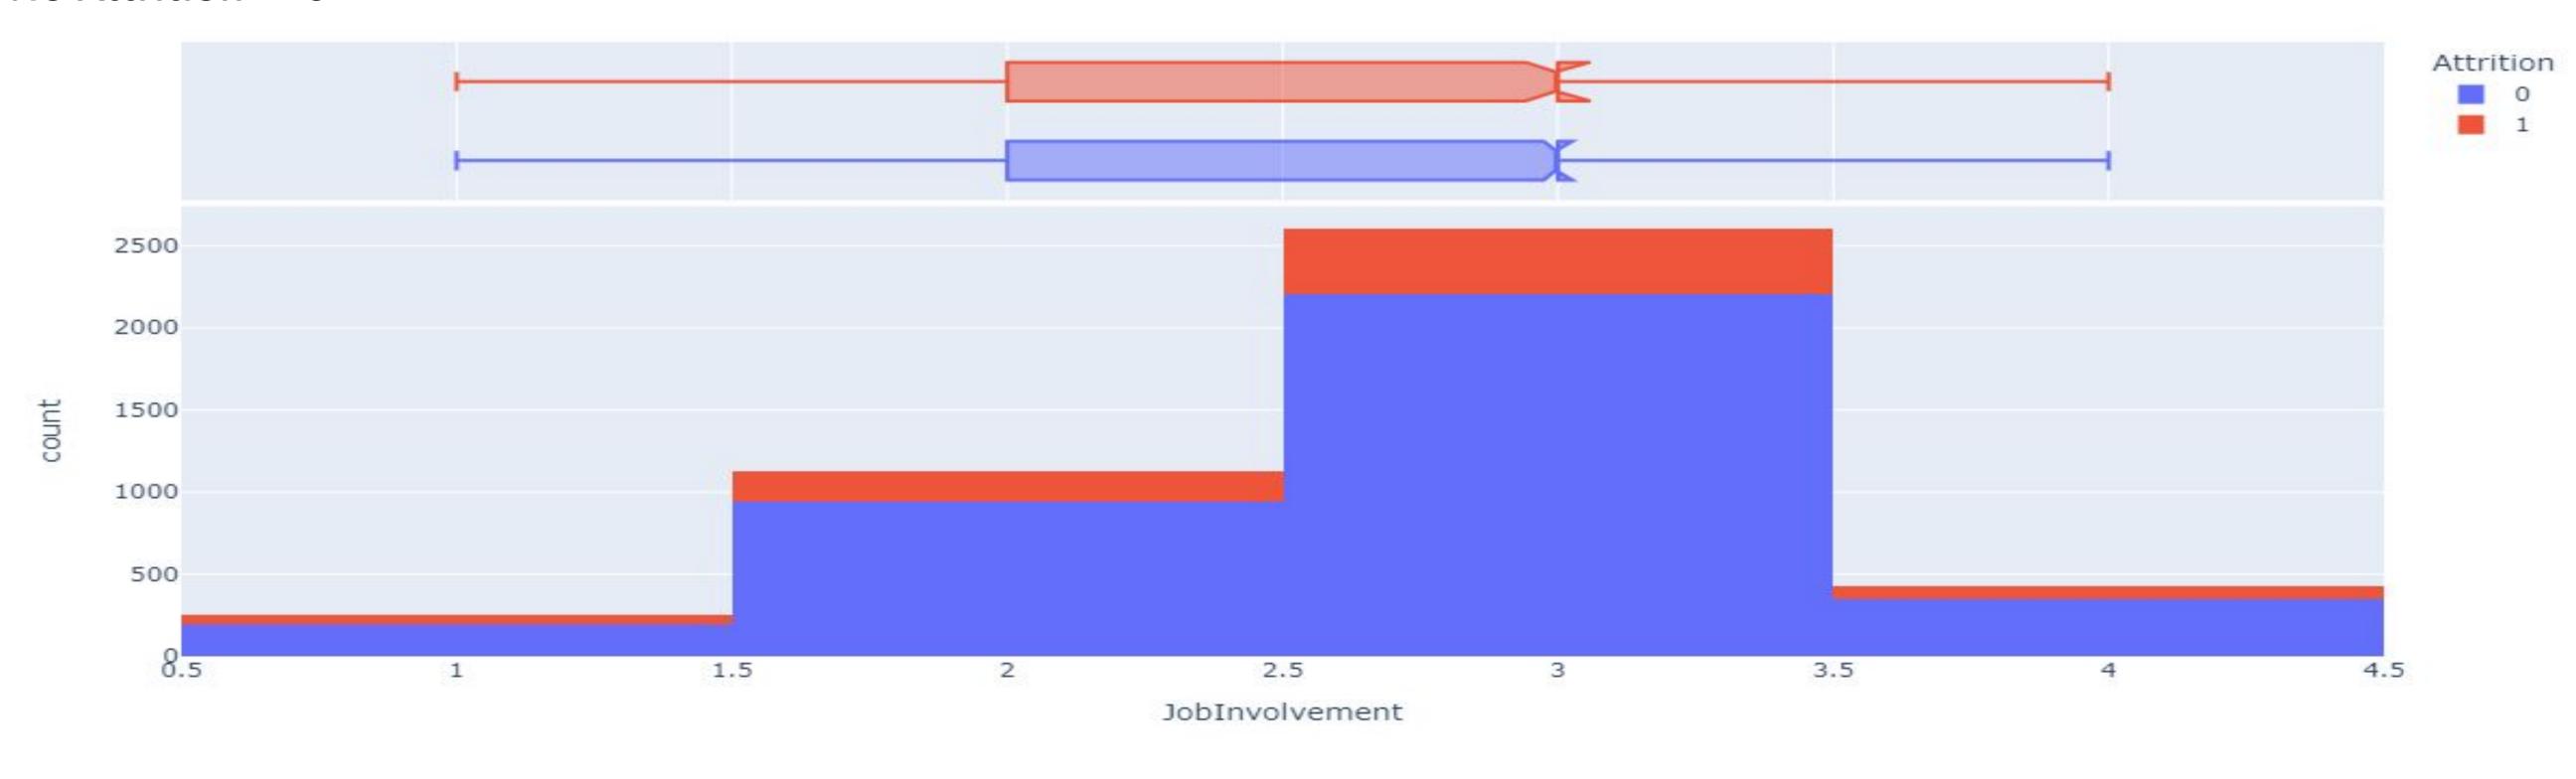

Attrition ->1

Feature: Work Life Balance and Job Involvement

Attrition ->1

Takeaways

Data Insights

- Job Involvement- 3 level.
- Work Life Balance 3 level.
- Job Satisfaction -1, 3 and 4 levels.
- Environment Satisfaction-1,2,3 4 levels.
 - Most people who leave the job aren't satisfied with the work environment.

Suggestions

- Regular Feedback and Recognition
 - Provide regular feedback and recognition to staff to keep them motivated and engaged.
- Flexible Work Arrangements
 - Offer flexible work schedules, remote work options, or compressed workweeks.
- Discourage Overtime
 - Set clear expectations about working hours and discourage excessive overtime.
- Open Communication
 - Foster a culture of open communication where employees feel comfortable voicing their concerns and suggestions.
- Positive Workplace Culture
 - Promote a positive and respectful work environment. Address conflicts promptly, encourage collaboration, and celebrate team achievements.

Takeaways

Suggestions

Employee Well-being

 Invest in employee well-being initiatives such as on-site fitness programs, wellness workshops, or Employee Assistance Programs (EAPs).

Meaningful Work

 Employees crave a sense of purpose. Ensure employees understand how their role contributes to the company's overall goals.

Recognition and Rewards

 Publicly acknowledge and reward employee achievements. This can be through verbal praise, bonus programs, or promotion opportunities.

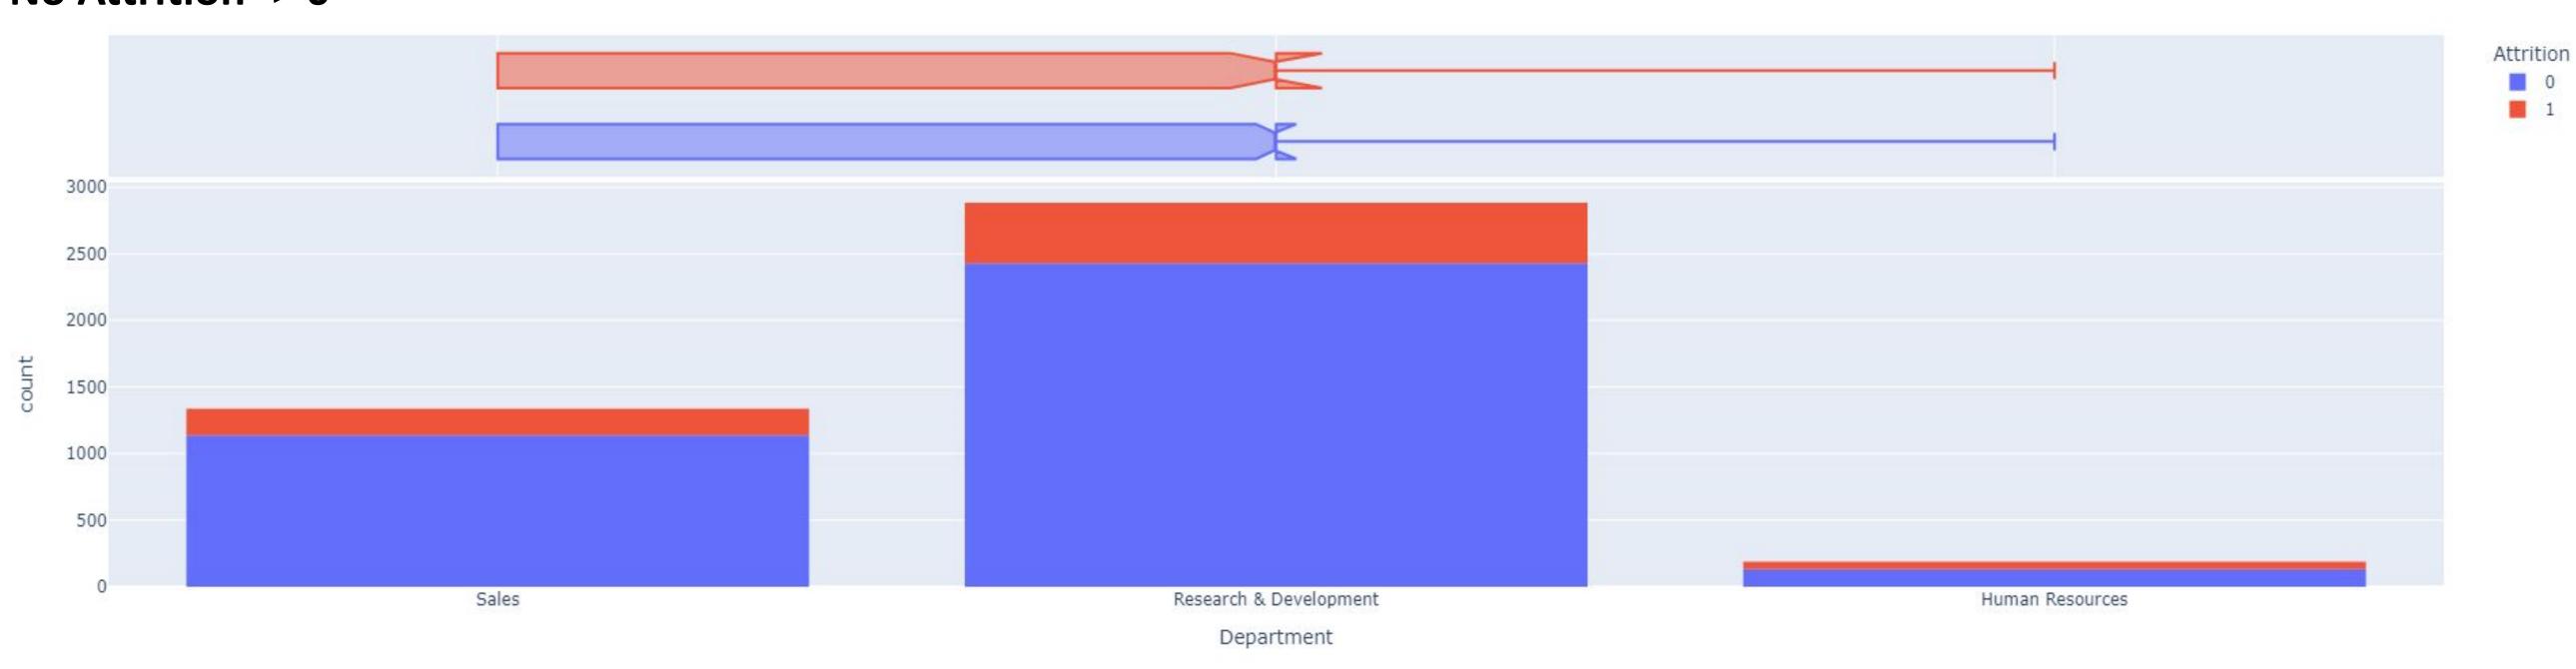

Growth and Development

 Provide opportunities for continuous learning and development. Offer training programs, mentorship opportunities.

Correlation Between Different Features

There are high correlations among some features:

- PercentsalaryHike and PerformanceRating.
- YearsatCompany, YearsSinceLastPromotion, and YearsWithCurrManager.

Feature Selection

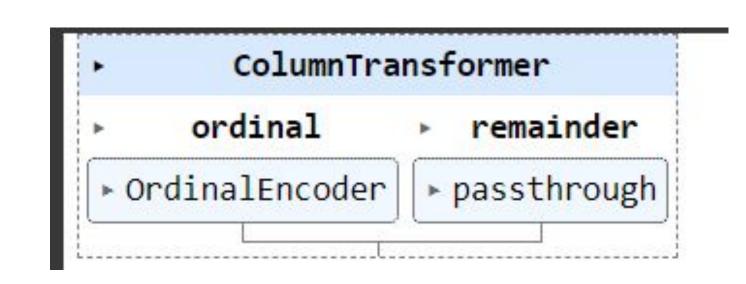

- Correlation matrix is used to identify highly correlated features. Removing highly correlated features can help improve ML model performance by avoiding multicollinearity.
- Correlation doesn't imply causation.

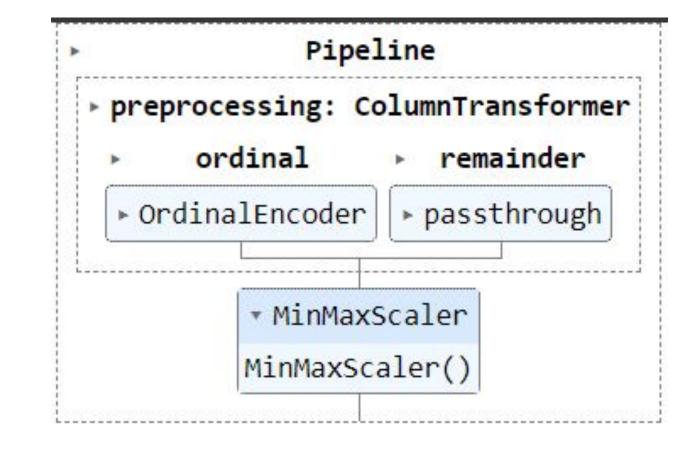

All Features:

```
Features: 'Age', 'BusinessTravel', 'Department', 'DistanceFromHome', 'Education', 'EducationField', 'Gender', 'JobLevel', 'JobRole', 'MaritalStatus', 'MonthlyIncome', 'NumCompaniesWorked', 'PercentSalaryHike', 'StockOptionLevel', 'TotalWorkingYears', 'TrainingTimesLastYear', 'JobInvolvement', 'EnvironmentSatisfaction', 'JobSatisfaction', 'WorkLifeBalance'], dtype='object')
```

Performance of Classifiers

Precision, recall, and F1 score are all metrics used to evaluate the performance of a classification model.

Precision:

Focuses on positive predictions: Measures the proportion of predicted positive cases that are actually correct.

Calculation: Precision = True Positives / (True Positives + False Positives)

Interpretation: A high precision indicates that most of the positive predictions made by the model were accurate.

However, it doesn't tell you anything about the negative predictions.

Recall:

Focuses on true positives: Measures the proportion of actual positive cases that were correctly identified by the model.

Calculation: Recall = True Positives / (True Positives + False Negatives)

Interpretation: A high recall indicates that the model identified most of the actual positive cases. However, it doesn't tell you anything about the false positives (incorrectly predicted positive cases).

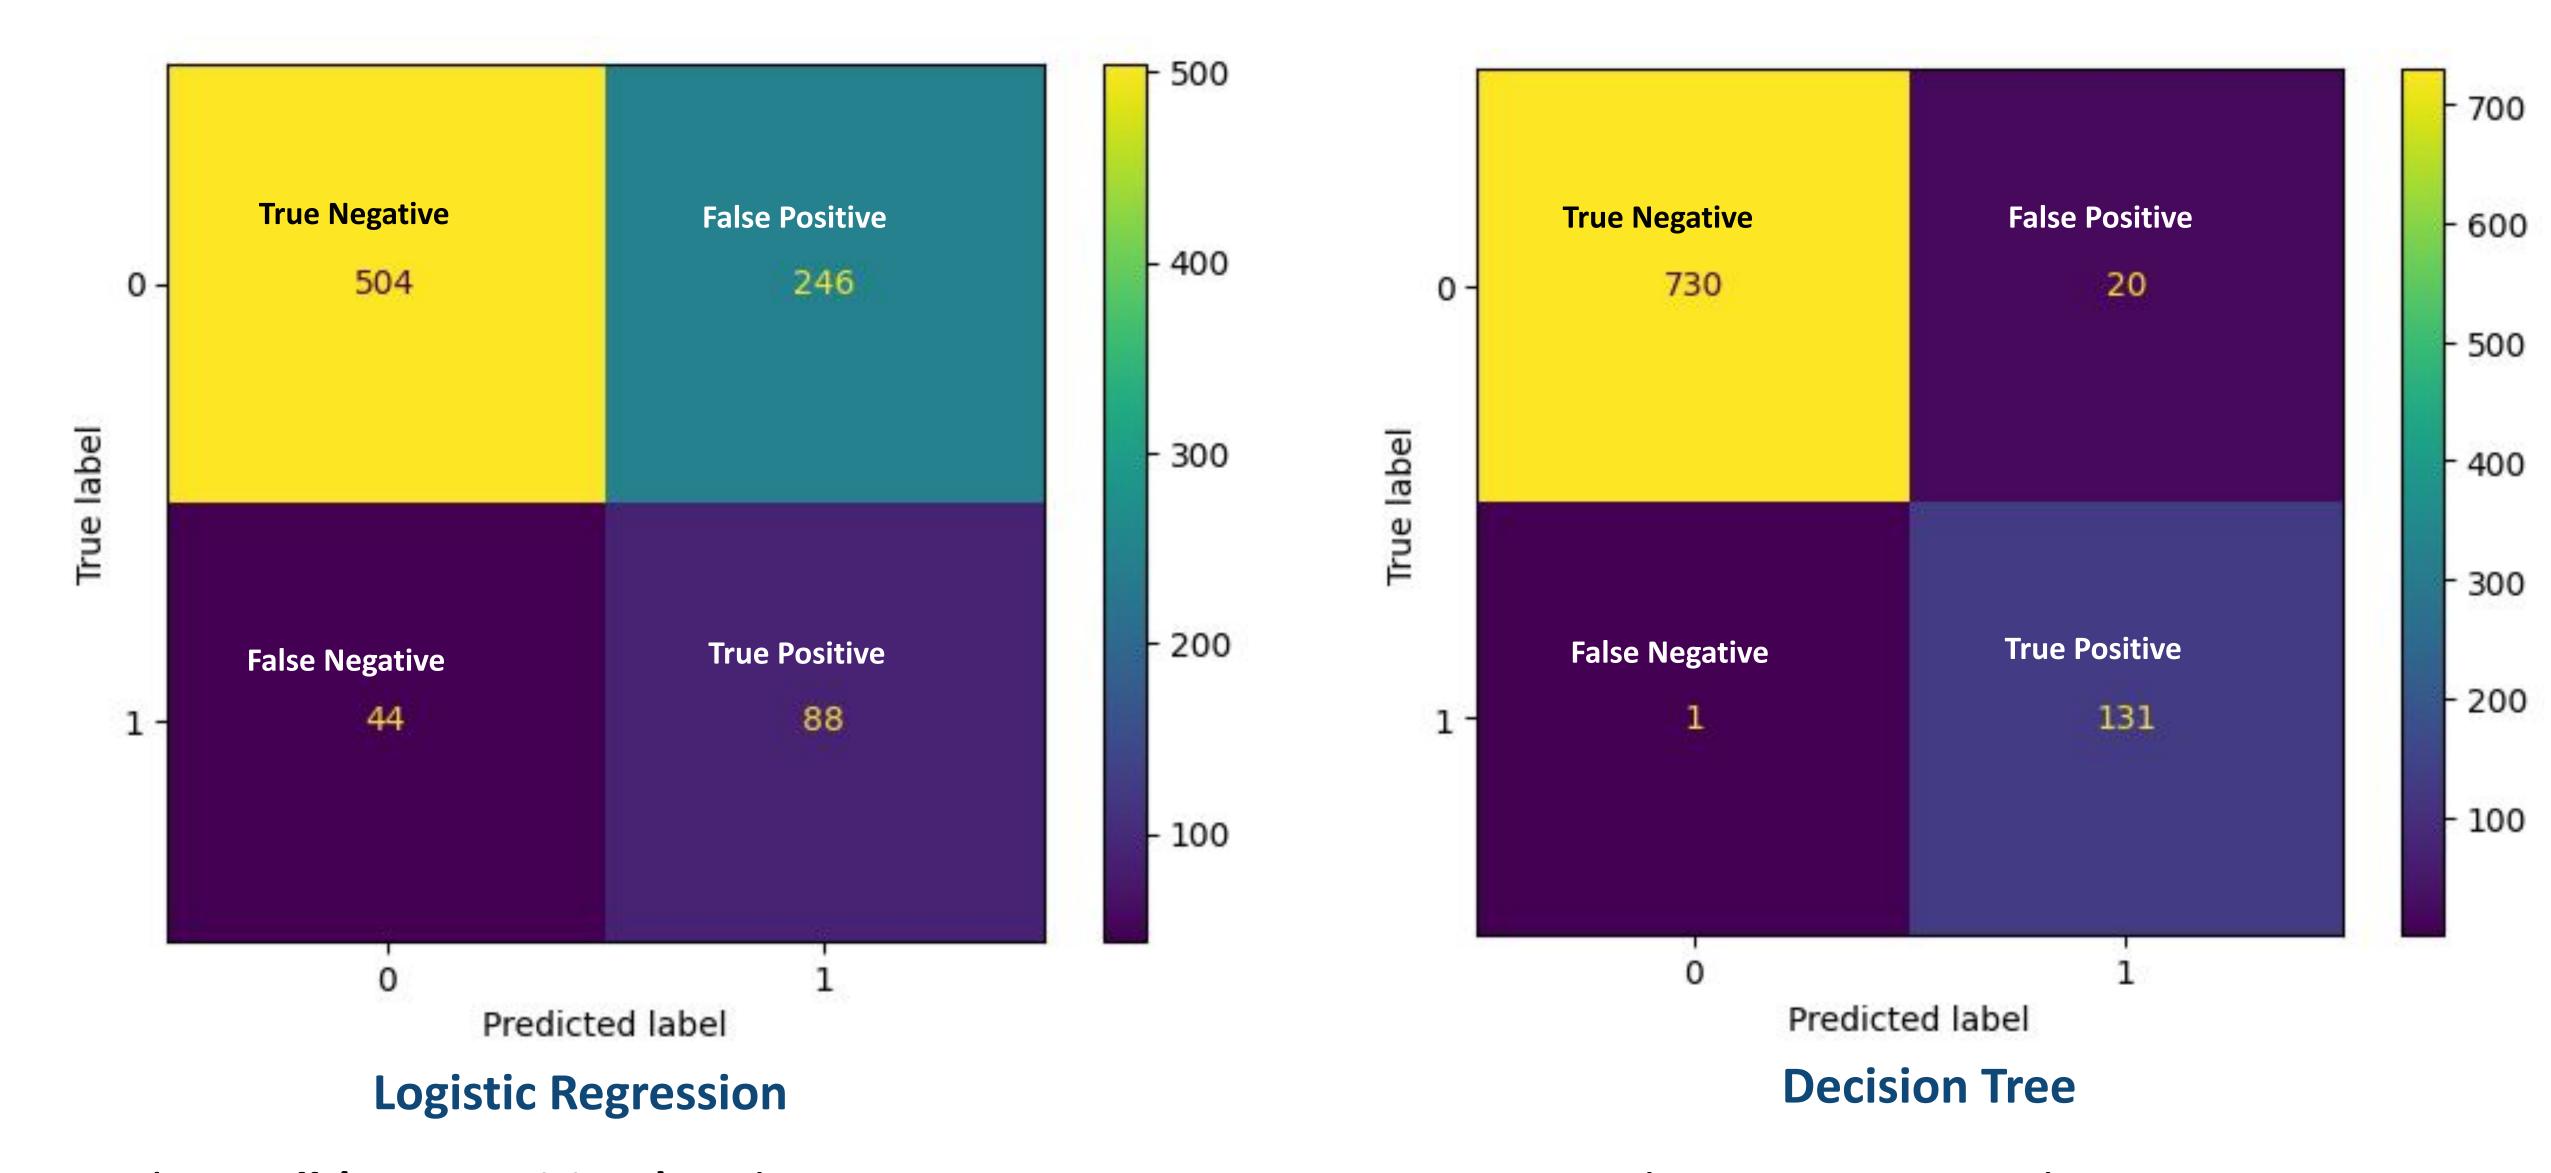

F1 Score:

Combines precision and recall: It's a harmonic mean of precision and recall, providing a single metric to balance both aspects.

Calculation: F1 Score = 2 * (Precision * Recall) / (Precision + Recall)

Interpretation: A high F1 score indicates that the model is performing well at both identifying true positives and minimizing false positives. It's a good overall measure for imbalanced datasets where one class might be more important than the other.

Confusion Matrix

- Both Recall (True Positives) and F1 Score are important metrics to consider in attrition prediction.
- F1 score combines precision and recall.
- Type-II Error (False Negative) and Type-I Error(False Positive) of Decision Tree classifier are better than Logistic Regression Classifier.

Conclusion

- Decision trees are often better suited than logistic regression where we have complex and non-linear relationship between features and the target variable.
- Whereas logistic regression models the relationship between the features and the outcome variable as a linear function.

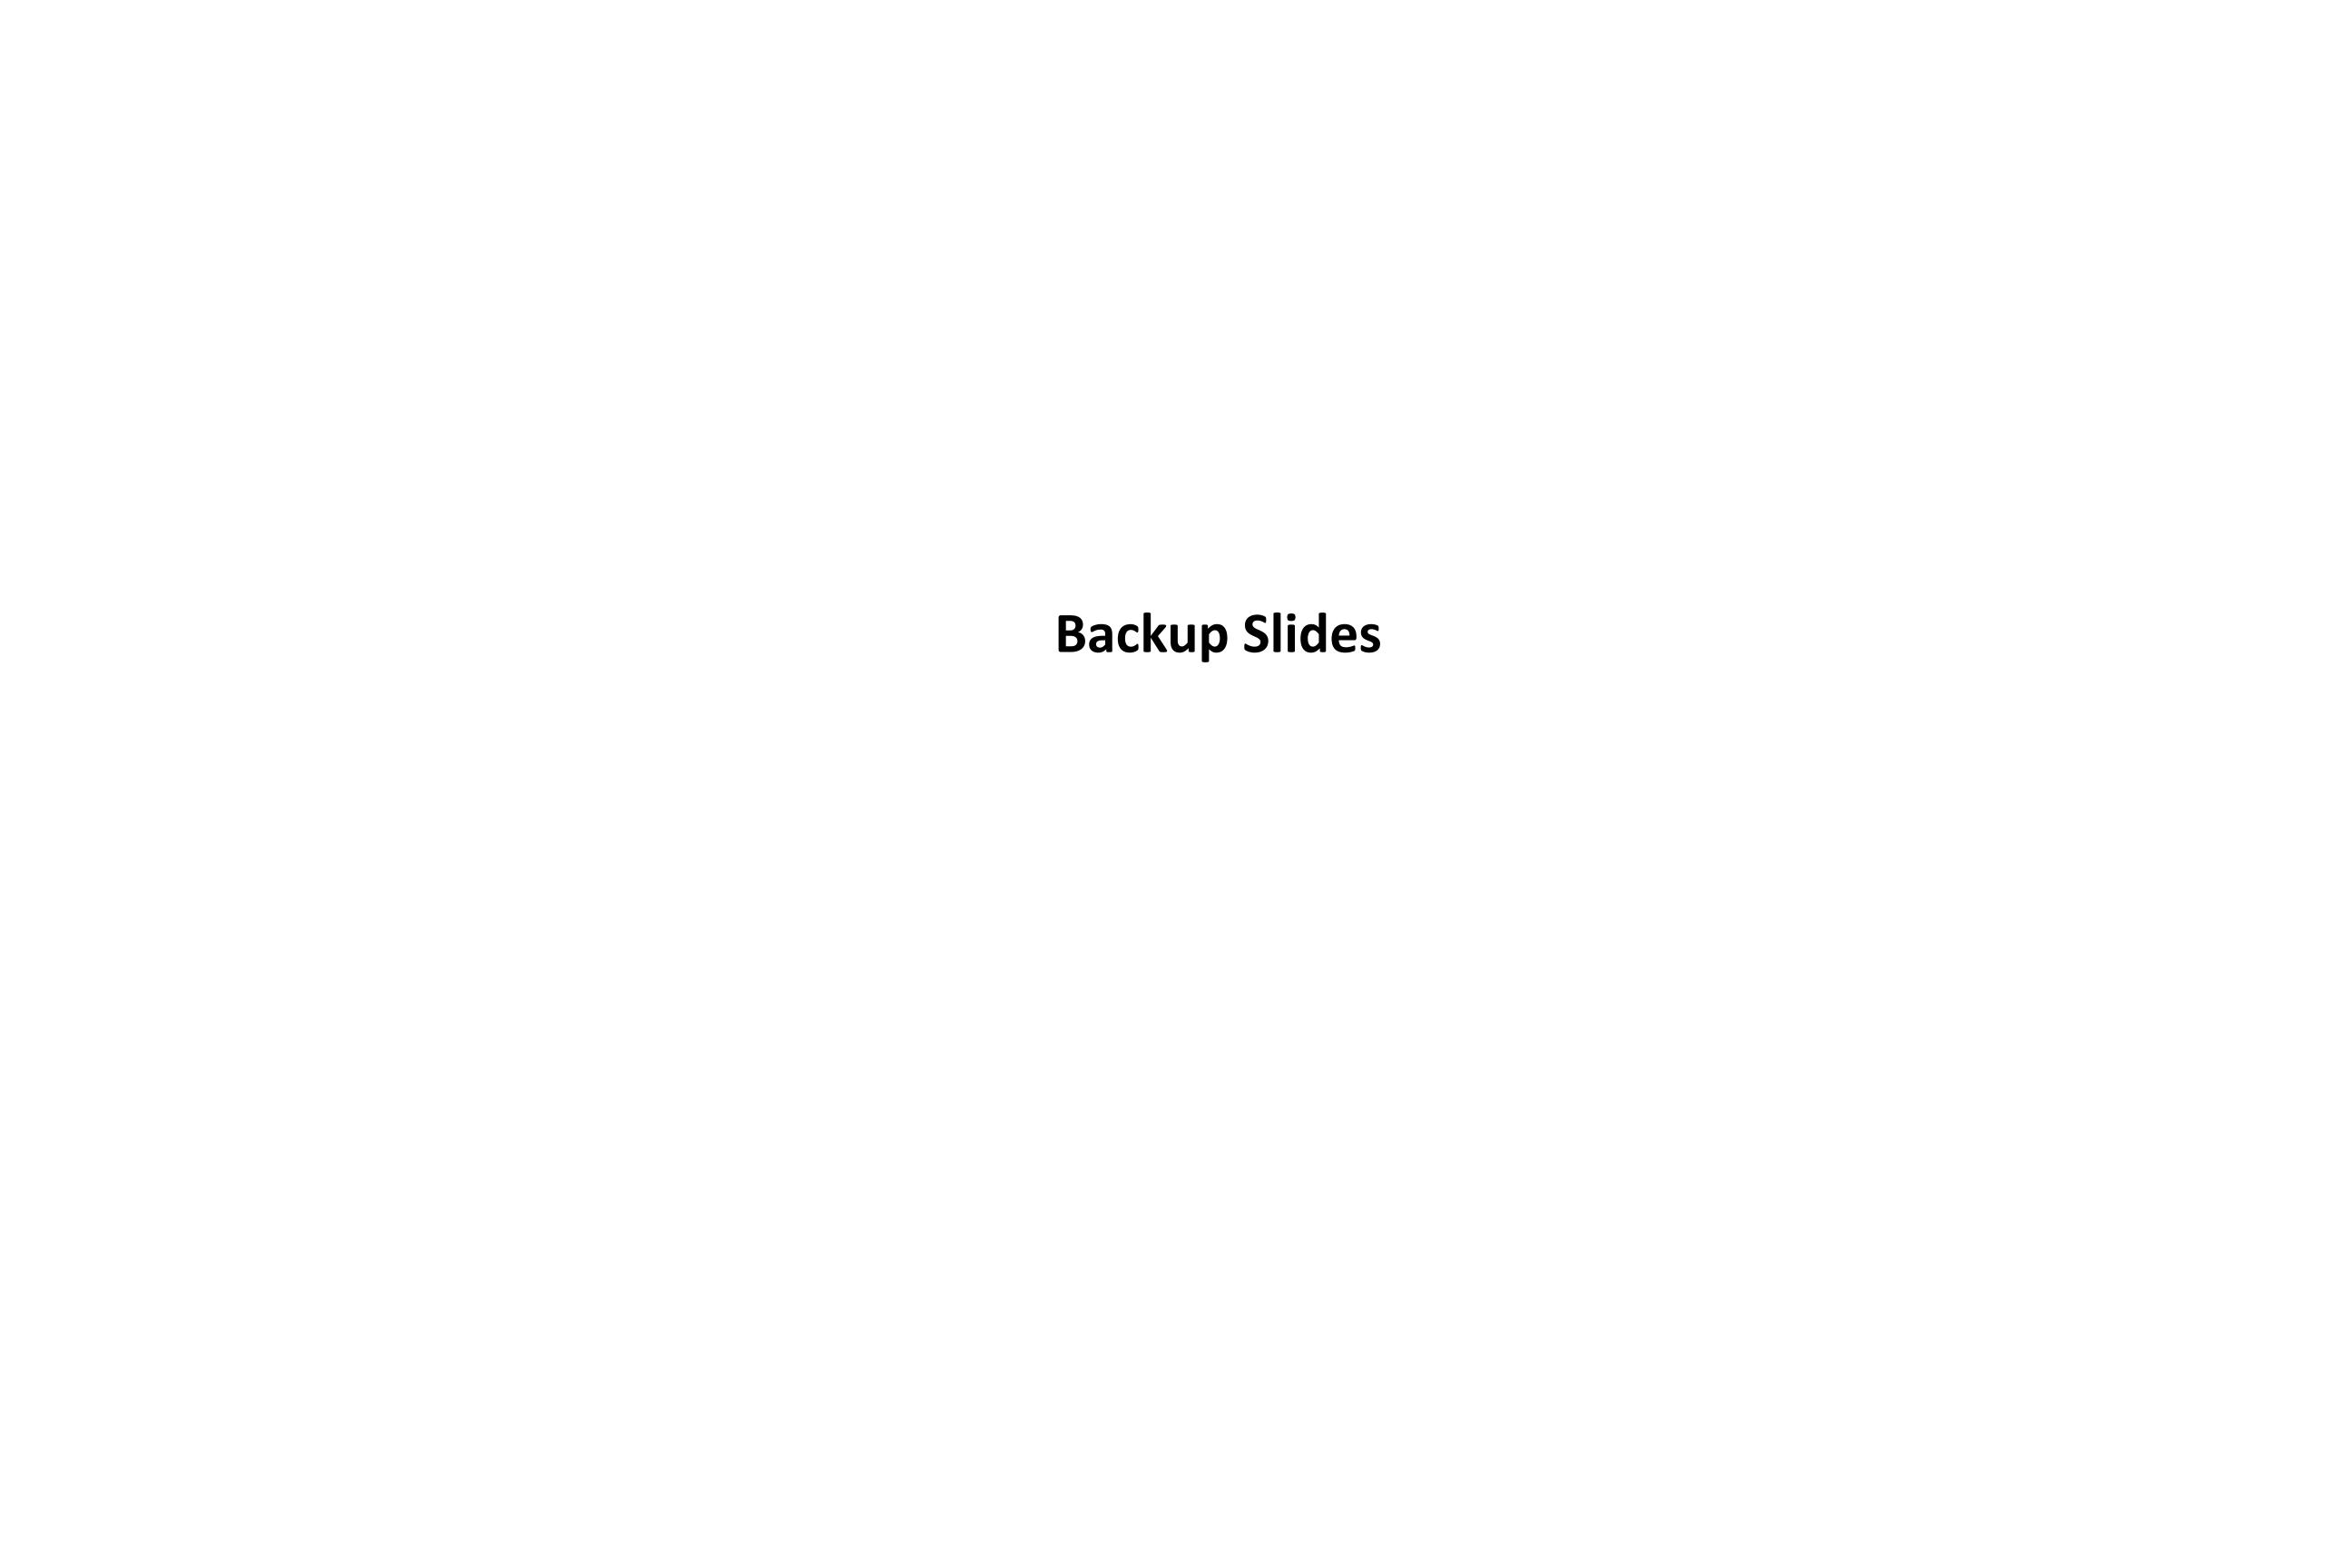

In this HR dataset, we will go with the decision trees.

- Better Recall and F1 Score.
- It can approximate non-linear relationship between features and the target variable.
- Feature selection is done to remove multicollinearity among features for ML model to perform best.
- Precision ->87%, Recall -> 97% and F1 Score ->93%.
 - Here we will consider **Recall** and **F1 Score** metrics more important to predict the attrition.

Conclusion (Contd.)

By leveraging a robust and generalizable machine learning model, HR can:

- Proactively identify employees at risk of leaving.
- Develop targeted interventions and retention programs to address specific employee needs.
- Improve overall employee satisfaction and morale.
- Reduce the negative impacts associated with employee churn.

Workflow - ML Model

```
encoder = ColumnTransformer (transformers=[
     #('ohe', OneHotEncoder(drop='first', sparse=False),
       ('ordinal', OrdinalEncoder(),['BusinessTravel', 'Department', 'EducationField', 'Gender', 'JobRole', 'MaritalStatus']), # One-hot encoding with drop_first=True for 'Gender'
  remainder='passthrough' # Keep the other columns unchanged
 setting to get a pandas df
encoder.set_output(transform='pandas')
     ColumnTransformer
